

## 8-bit LCD Interface Notes (Crystalfontz LCD)

### LCD Panel Pinouts and Connections to CPU (for data bus connectivity)

- Verify that the position of pin 1 on your LCD board. There should be a 1 next to pin 1 and a 16 next to pin 16. Our LCD panel is arranged as shown to the right (as viewed from the display side of the LCD). Note that to read the text on the LCD properly, the pins should be on the top, as shown in the figure.
- The register select signal (RS) determines whether the Data Bit values are interpreted as a command or data (aka: a character to display).
- The enable pin (E) functions as the command/data latching signal for the LCD. The LCD will latch in whatever is on the Data Bits and process it on the falling edge of the E signal. **We have found that it is sometimes necessary (and should therefore ALWAYS be done) to use both R and W (when they are separate signals in your microprocessor) in the LCD\_EN signal going to the LCD's E.** This seems to be due to a much narrower W than CS=f(Addresses), i.e., W goes false when CS is still true.
- We are using the LCD in Read and Write mode. If you want to read from the device, DB7 is the busy flag (BF) that when clear means the LCD is ready for the next command. If this is done the delays in the below flow chart are unnecessary.

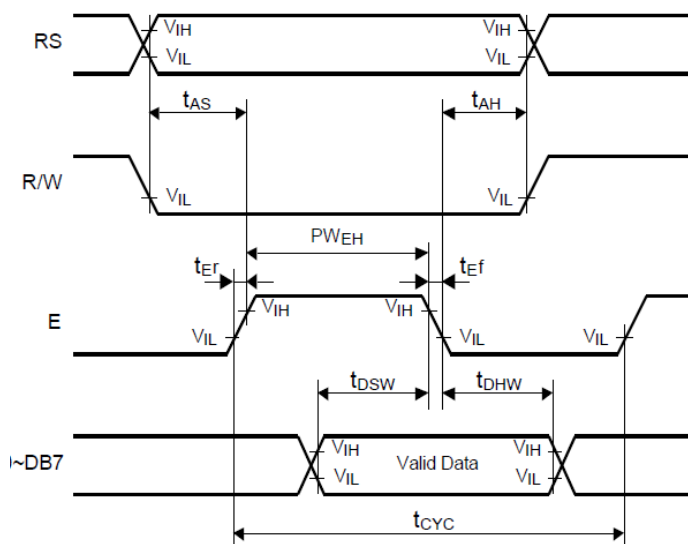

LCD Board Pinout

- You can verify that your LCD works properly before connecting your LCD data pins. Give power to the device and twist the potentiometer one way or the other until you **may** see black lines appear. But these lines may not appear on some (i.e., our 3.3V LCDs); if the lines do not appear, you will first have to send something to the LCD before effectively adjusting the potentiometer.
- Data or commands are read at the **falling edge of E**, as shown in the timing diagram below

The Densitron LM2022 LCD specifications (posted on our website) are shown below. Our Crystalfontz LCD specifications are similar, and also posted on our website. The timing diagrams (see below) are the same.

| Parameter (in ns)     | Symbol            | Min | Max |
|-----------------------|-------------------|-----|-----|
| Enable Cycle Time     | $T_{CYC}$         | 500 | —   |
| Enable Pulse Width    | $PW_{EH}$         | 230 | —   |
| Enable Rise/Fall Time | $t_{Er} / t_{Ef}$ | —   | 20  |
| Address Setup Time    | $t_{AS}$          | 40  | —   |
| Address Hold Time     | $t_{AH}$          | 10  | —   |
| Write Data Setup Time | $t_{DSW}$         | 80  | —   |
| Write Data Hold Time  | $t_{DHW}$         | 10  | —   |

## 8-bit LCD Interface Notes (Crystalfontz LCD)

| LCD Pin assignments   |                 |     |   |

| 13  | DB6             | I/O | Bi-directional data bus line 6  |
| 14  | DB7 (BF*)       | I/O | Bi-directional data bus line 7 (MSB)  |
| 15  | A (LED +)       | -   | Optional: LED Backlight Anode   |
| 16  | A (LED -)       | -   | Optional: LED Backlight Cathode   |

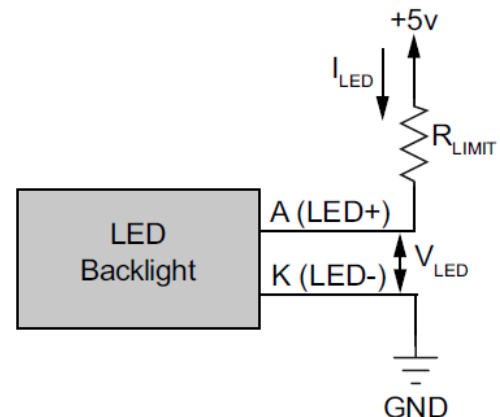

\* BF is the busy flag

### Contrast and Optional Backlight Information

The optimal contrast for the LCD (V<sub>O</sub>) is 3.3 - 3.7V, but this may vary with viewing angle, ambient temperature and per-LCD.

Setting the backlight up is optional, but may increase the readability of the LCD and is pretty cool. The backlight on your LCD is one large green LED. From the Crystalfontz documentation, the backlight requires a current-limiting resistor in the configuration shown to the right. The formula for calculating this value is shown below. LED Forward Voltage and Forward Current are 4.1V and .12A, respectively, from the Crystalfontz documentation.

$$R_{limit_{min}} = \frac{V_{DD} - V_{LED}}{I_{LED}}$$

### Initialization

The module powers up in 8-bit mode. Additional commands are required to put the module into 4-bit mode; however, we are going to continue using it in 8-bit mode. The suggested initialization sequence is shown below under Normal Further Initialization.

### Normal Further Initialization

<Wait 40us or till BF=0>

(Two lines) [DB=\$38]

## 8-bit LCD Interface Notes (Crystalfontz LCD)

### SUMMARY OF LCD COMMANDS

| Instruction                        | Code |     |            |               |               |     |     |     |     |     | Description   |
|------------------------------------|------|-----|------------|---------------|---------------|-----|-----|-----|-----|-----|---|
|                                    | RS   | R/W | DB7        | DB6           | DB5           | DB4 | DB3 | DB2 | DB1 | DB0 |   |
| Clear display                      | 0    | 0   | 0          | 0             | 0             | 0   | 0   | 0   | 0   | 1   | Clears display and returns cursor to the home position (address 0).   |
| Cursor home                        | 0    | 0   | 0          | 0             | 0             | 0   | 0   | 0   | 1   | *   | Returns cursor to home position (address 0). Also returns display being shifted to the original position. DDRAM contents remains unchanged. |
| Entry mode set                     | 0    | 0   | 0          | 0             | 0             | 0   | 0   | 1   | I/D | S   | Sets cursor move direction (I/D), specifies to shift the display (S). These operations are performed during data read/write.                |
| Display On/Off control             | 0    | 0   | 0          | 0             | 0             | 0   | 1   | D   | C   | B   | Sets On/Off of all display (D), cursor On/Off (C) and blink of cursor position character (B).   |
| Cursor/display shift               | 0    | 0   | 0          | 0             | 0             | 1   | S/C | R/L | *   | *   | Sets cursor-move or display-shift (S/C), shift direction (R/L). DDRAM contents remains unchanged.   |
| Function set                       | 0    | 0   | 0          | 0             | 1             | DL  | N   | F   | *   | *   | Sets interface data length (DL), number of display line (N) and character font(F).  |
| Set CGRAM address                  | 0    | 0   | 0          | 1             | CGRAM address |     |     |     |     |     | Sets the CGRAM address. CGRAM data is sent or received after this setting.  |
| Set DDRAM address                  | 0    | 0   | 1          | DDRAM address |               |     |     |     |     |     | Sets the DDRAM address. DDRAM data is sent or received after this setting.  |
| Read busy-flag and address counter | 0    | 1   | BF         | DDRAM address |               |     |     |     |     |     | Reads Busy-flag (BF) indicating internal operation is being performed and reads address counter contents.                                   |
| Write to CGRAM or DDRAM            | 1    | 0   | write data |               |               |     |     |     |     |     | Writes data to CGRAM or DDRAM.  |
| Read from CGRAM or DDRAM           | 1    | 1   | read data  |               |               |     |     |     |     |     | Reads data from CGRAM or DDRAM.   |

| B         | 0 = Cursor blink off          | 1 = Cursor blink on                |
| S/C       | 0 = Move cursor               | 1 = Shift display                  |
| R/L       | 0 = Shift left                | 1 = Shift right                    |
| DL        | 0 = 4-bit interface           | 1 = 8-bit interface                |
| N         | 0 = 1/8 or 1/11 Duty (1 line) | 1 = 1/16 Duty (2 lines)            |
| F         | 0 = 5x7 dots                  | 1 = 5x10 dots                      |
| BF        | 0 = Can accept instruction    | 1 = Internal operation in progress |

### Notes:

- DDRAM = Display Data RAM.
- CGRAM = Character Generator RAM.
- DDRAM address corresponds to cursor position.
- Address Counter is used for both DDRAM and CGRAM.
- \*= Don't care.
- DL: 0 = 4-bit interface; 1 = 8-bit interface
- N: 0 = 1 line; 1 = 2 lines
- F: 0 = 5x7 dots; 1 = 5x10 dots
- For more info, see:
